

Renato Hysa

Software Engineer

Profile

I love open source and teaching others.

Currently I am working full-time on my e-learning platform, [Devlob](#).

I have courses on API development in Laravel using TDD, Laravel, VueJS and Design Patterns in PHP.

Programming is not simply my job, it is my **PASSION!** I don't write code just to make things work, no! I always follow principles, design patterns and use testing. My code is my creation and I take care of it!

I also love writing on blogs. I used to write on [Medium](#). Currently I have 165.000 views on all my posts. By searching on Google "[Laravel api](#)" you can find my post at the first page, #6. However, now I write everything on [my blog](#).

I love quality and hate quantity. I make sure to provide the best possible experience, doesn't matter if it is work for a client, an online course or a blog post!

I started programming in 2007 with HTML. Later I moved to Pascal and VB.NET.

I also have a [YouTube channel](#) with over 21K subscribers with tutorials on Laravel and VueJS. The tutorials rank at the top on YouTube, you can search for Laravel 5.8 for example and my video is #1. On YouTube I have more courses.

I have a bunch of unfinished projects in Laravel, VueJS, ElectronJS, etc. We can Skype and I can show them to you locally.

Employment History

Fullstack Software Engineer at Versacchi, Ireland, Cork

February 2016 - October 2018

<https://q.tk>

This is a big system implemented in Laravel, VueJS, and GraphQL (for some features). Multiple microservices connect to this system.

The idea behind this project was to sell stickers, keychains, etc. for medical reasons. On top of those products a QR code was printed and in case of emergency, doctors or citizens could scan it and find medical information for that person.

The project would have been used by hospitals in Ireland, but unfortunately development stopped because the investor died suddenly from a heart attack in October 2018.

Some of the systems implemented for this project are a Marketing system, hooks for WordPress and Stripe, PDF sticker generation for medical records, Payment Terminals (Stripe and PayPal supported), a Gym system, etc.

Hobbies

Salsa and Bachata, Domain investor

Fullstack Software Engineer at Devlob, Tirana

March 2015 – January 2019

This is my personal project.

The project includes features such as e-learning, blog, forum and a social network.

The platform was build in Lumen, NuxtJS and GraphQL and is a PWA.

All the courses and blog posts at this moment are mine, in the future I will open the platform to the public.

You are welcome to register and test my baby. I have gone through 4 redesigns until I decided with the current technologies.

Fullstack Software Engineer at LTC, USA, Boston

February 2017 – January 2018

This was a project for a client in USA.

The idea was to build a platform where users could find places to eat and stay.

Imagine a combination of TripAdvisor and Yelp. Users could rate places, manage venues, etc.

A lot of work had been done on that project, but the client decided to stop development due to a small budget. The site is not online, but I can deploy it if you need to take a look at it.

PHP and C# developer at Vivido, Durres

February 2014 – December 2014

I used to work for an Italian company.

Most of my work was on Laravel (4 at that time) and vanilla PHP.

Later I moved to C# since I had some experience using .NET.

Remote developer at Internet, Remote

December 2013 – October 2018

I have worked on small and big projects since 2013.

All of my projects came due to open sourcing, teaching, blogs, etc.

Education

Bachelor of Computer Science (dropped out), University of New York Tirana, Tirana

October 2011 – October 2015

I am not against education, the opposite, I am sharing my knowledge to help others and I love it. But this won't stop universities from being a business that won't care for its students. I decided to drop-out of college on my last year and try my luck by looking for a job.

When I got my first big job I was shocked to find out that what I was taught at college was outdated and didn't help me at all to land the job. I never went back! However, I took that bad experience and turned it into passion for teaching others. My goal is to create a better educational system for the world through [Devlob](#).

My views are my own and based on my experience in Albania.

Because of that experience I decided to work in the e-Learning industry. That bad experience made me a better person.

Now, I am more accepted to new things and willing to listen to other people more.
